Summary

Sac

Overview

- Cut-elimination is a proof transformation that removes all cut rules from a proof.
- The cut-elimination theorem was proved by Gerhard Gentzen in 1934.
- For the systems, that have a cut-elimination theorem, it is easy to prove consistency.
- Cut-elimination is nonelementary in general, i.e. there is no elementary bound on the size of cut-free proof w.r.t the original one.

Cut-elimination Methods

Summary

Sac

Sequent Calculus LK

- A sequent is an expression of the form $\Gamma \vdash \Delta$, where Γ and Δ are lists of formulas.
- A rule is an inference of a lower sequent from an upper sequent(s).
- A derivation is a directed tree with nodes as sequences and edges as inferences.
- A proof of the sequence *S* is a derivation of *S* with axioms as leaf nodes.

Implementation and Demonstration

Summary

Sac

Cut rule

• The cut rule:

$$\frac{\Gamma\vdash\Delta,A}{\Gamma,\Pi\vdash\Delta,\Lambda}\frac{A,\Pi\vdash\Lambda}{cut}$$

- The *cut* rule is the only rule such that its upper sequents may contain formulas that do not appear in the lower sesuents.
- The *cut* rule is the only rule that may produce an empty sequent ⊢ (inconsistency).
- The upper sequents of a *cut* rule corresponds to the lemmas into the proof.

Summary

nac

Gentzen's method of cut-elimination

- Gentzen's method of cut-elimination is reductive, i.e. proof rewriting system is defined which is terminating and its normal form is a cut-free proof.
- Rewriting rules are divided into two parts: grade reduction and rank reduction rules.
- Grade of a cut rule is the number of logical symbols in the cut-formula.
- Rank of a cut rule is the number of sequents in the left cut-derivation, where cut-formula occurs in its succedent plus the number of sequents in the right cut-derivation, where the cut-formula occurs in its antecedent.

The method CERES

- CERES is a cut-elimination method by resolution.
- The CERES method radically differs from reductive methods.
- The CERES method consists of the following steps:
 - 1. The skolemization of the proof (if it is not already skolemized).
 - 2. The computation of the characteristic clause set.
 - 3. The refutation of the characteristic clause set.
 - 4. The computation of the proof projections and construction of the atomic cut normal form.

Summary

Sac

The system CERES

CERES system consists of the following parts:

HLK :

Program, that is used to formalize mathematical proofs and generate input for CERES.

CERES :

Program, that is used to transform formal proofs and extract relevant information.

ProofTool:

Program, that is used to visualize these formal proofs.

Summary

Sac

Sequent Calculus LKII

The calculus **LKII** is defined as calculus **LK** plus following second order quantifier rules:

$$\frac{A(X/\lambda\bar{x}.F), \Gamma \vdash \Delta}{(\forall X)A, \Gamma \vdash \Delta} \forall : 1 \quad \text{and} \quad \frac{\Gamma \vdash \Delta, A(X/\lambda\bar{x}.F)}{\Gamma \vdash \Delta, (\exists X)A} \exists : r$$
$$\frac{A(X/Y), \Gamma \vdash \Delta}{(\exists X)A, \Gamma \vdash \Delta} \exists : 1 \quad \text{and} \quad \frac{\Gamma \vdash \Delta, A(X/Y)}{\Gamma \vdash \Delta, (\forall X)A} \forall : r$$

Where X is a second order variable, F is a first order formula with free variables not bound in A and bound variables of F not in A. Y is a second order eigenvariable of the same type as X.

Summary

Sar

Extension for LKII

Aim :

Extend CERES system to the second order calculus.

Problems :

* Second order clauses are not closed under substitution.

* Skolemization of the end-sequent is not enough, eigenvariable conditions can be still violated, as the active formulas of strong quantifier rules may be ancestors of formulas removed by weak second-order quantifier rules and therefore, the corresponding strong quantifiers will not be present in the end-sequent.

Cut-elimination Methods

Implementation and Demonstration 00

Summary

500

Extension for LKII (ctd.)

- There is on going work to solve these problems.
- Other solution was to extend Gentzen's method and implement it.
- Second order reduction rules:

$$\frac{\begin{array}{cc}\phi_{l} & \phi_{r} \\ \hline \Gamma_{1} \vdash \Delta_{1}, A(X/Y) \\ \hline \hline \Gamma_{1} \vdash \Delta_{1}, (\forall X)A \\ \hline \hline \Gamma_{1}, \Gamma_{2} \vdash \Delta_{1}, \Delta_{2} \\ \hline \end{array} \forall : \mathbf{r} \quad \frac{A(X/\lambda \bar{x}.F), \Gamma_{2} \vdash \Delta_{2}}{(\forall X)A, \Gamma_{2} \vdash \Delta_{2}} \forall : \mathbf{l}$$

transform to

$$\frac{\phi_l(Y/\lambda \bar{x}.F) \qquad \phi_r}{\Gamma_1 \vdash \Delta_1, A(X/\lambda \bar{x}.F) \qquad A(X/\lambda \bar{x}.F), \Gamma_2 \vdash \Delta_2} \operatorname{cut}$$

Cut-elimination Methods

Implementation and Demonstration $\bullet \circ$

Summary

Sac

Implementation

- The system CERES is written in C++.
- Our algorithm is the following:
 - Select leftmost topmost cut.
 - Try to reduce grade in the following order: second order quantifiers, first order quantifiers, ⊃, ∧, ∨, ¬.
 - Try to reduce rank first on the left, then on the right cut-derivation in the following order: weakening rule cases, axiom rule cases, contraction rule cases, arbitrary unary and binary rule cases, permutation rule cases.
 - Repeat until all cuts are eliminated.

Cut-elimination Methods

Implementation and Demonstration

Summary

Demonstration

Let now run program with some short proofs.

Cut-elimination Methods

Implementation and Demonstration

Summary

Sac

Summary

- We extended Gentzen's method to the second order calculus.
- We extended CERES system to handle second order proofs.
- We can compare performance of the different methods of cut-elimination.
