Outline

Giles Style Dialogue Games

- Motivation
- Description
- Adequateness for Łukasiewicz Logic
- 2 t-Norm Based Fuzzy Logics

Variants of Giles's Game for Other Logics

Implementation

- Giles Games
- Hypersequential Proofs
- Truth Comparison Games
- Webgame

Overview of Giles's Game I

Motivation

- introduced by Robin Giles in the 1970s
- aim: model reasoning in physical theories
- provide a tangible meaning to (compound) propositions
- corresponds to Łukasiewicz Logic

Overview

- atomic propositions are identified with binary experiments
- experiments may show dispersion
- at any point in the game each player asserts a (multi)set of propositions
- game is divided into two seperate parts:
 - deconstruction of complex propositions
 - evaluation of atomic game states

Overview of Giles's Game I

Э

Overview of Giles's Game II

Risk Values

- after playing the game both players have to pay a certain amount of money to each other
- the expected amount a player has to pay is called his risk value
- both players aim to minimize their risk

Game Interpretation

- primarily an evaluation game
- fixed assignment of probability values to experiments
- finite two-player zero-sum game with perfect information
- truth of a proposition *F* is identified with the existence of a winning strategy for a player asserting *F*

Evaluating Final Game States

Assume that both players assert only atomic propositions.

Betting for Positive Results

Let a be an atomic proposition. He who asserts a agrees to pay his opponent $1 \in$ if a trial of E_a yields the outcome "no".

- for each assertion of an atomic proposition a trial of the associated experiment is done
- for an atomic proposition a the corresponding experiment is denoted E_a
- the risk value for one player is the expected amount of money he has to pay in this game state

Evaluating Final Game States

In the following let the players be called you and me.

Example

Let *a* and *b* be atomic propositions associated with the experiments E_a and E_b and $\pi(E_a) = 0.3$ and $\pi(E_b) = 0.9$. Assume that you assert *a* and I assert both *a* and *b*.

When evaluating this final game state, the experiment E_a is conducted twice and E_b once. In the expected case you have to pay me $0.7 \in$ and I have to pay you $0.8 \in$. Thus, my risk value for this game state is $0.1 \in$.

Decomposing Complex Propositions

Assume that both players assert a (multi)set of arbitrary propositions.

General Game Rule

One player chooses a compound proposition asserted by the other one. Either

- he attacks it according to the corresponding dialogue rule. Then the other player has to defend his claim as indicated by the rule.
- or he grants the proposition to his opponent.

Afterwards the proposition is deleted from the game.

 The order in which the players attack each others' assertions is not specified.

Implication

He who asserts A
ightarrow B agrees to assert B if his opponent will assert A

Decomposing Complex Propositions

Assume that both players assert a (multi)set of arbitrary propositions.

General Game Rule

One player chooses a compound proposition asserted by the other one. Either

- he attacks it according to the corresponding dialogue rule. Then the other player has to defend his claim as indicated by the rule.
- or he grants the proposition to his opponent.

Afterwards the proposition is deleted from the game.

• The order in which the players attack each others' assertions is not specified.

Implication

He who asserts $A \rightarrow B$ agrees to assert B if his opponent will assert A

Other Rules

Disjunction

He who asserts $A \lor B$ undertakes to assert either A or B at his own choice if challenged

Conjunction

He who asserts $A \land B$ undertakes to assert either A or B at his opponent's choice

- Negation can be expressed using $\neg A \equiv A \rightarrow \bot$.
- Other rules suitable for conjunction and disjunction as well.
- Dialogue rules refer to Lorenzen (1960s).

ロト イポト イラト イラト

Łukasiewicz Logic Ł

- many-valued, truth functional fuzzy logic
- domain of truth values: unit interval [0,1]

Connectives of Łukasiewicz Logic

Connectives: \rightarrow , &, \land , \lor , \neg with truth functions:

•
$$f_{\to}(x,y) = \min(1,1-x+y),$$

•
$$f_{\&}(x,y) = \max(0, x+y-1)$$

•
$$f_{\wedge}(x,y) = \min(x,y),$$

•
$$f_{\vee}(x,y) = \max(x,y)$$
,

•
$$f_{\neg}(x) = 1 - x$$
.

A formula is called *true* in Ł under given interpretation iff it evaluates to 1.

ロト イポト イヨト イヨト

Adequateness of Giles's Game for Ł

Adequateness of Giles's Game for Ł

For a fixed assignment of probability values to atomic propositions and a corresponding interpretation, I have a strategy to ensure that my risk is 0 when asserting a formula *A*, if and only if *A* is true in Łukasiewicz Logic.

Correspondence Between Risk Values and Valuations

Let *v* be an interpretation corresponding to the assignment of probability values to atomic propositions, *A* be an arbitrary formula, and $\langle A \rangle$ be the risk value (for me) for the game starting with me asserting *A*. Then the valuation of *A* under *v* in \natural and the inverted risk value $1 - \langle A \rangle$ coincide.

Definition: t-Norm

Continuous t-norm

A continuous t-norm is a continuous, associative, monotonically increasing function $*: [0,1]^2 \rightarrow [0,1]$ where $1 * x = x \quad \forall x \in [0,1]$.

Residuum of a continuous t-norm *

The residuum of * is a function $\Rightarrow_*: [0,1]^2 \rightarrow [0,1]$ where $x \Rightarrow_* y := \max\{z | x * z \le y\}.$

- * is used as truth function for (strong) conjunction.
- \Rightarrow_* is used for as truth function implication.

ロト イポト イラト イラト

Definition: t-Norm

Continuous t-norm

A continuous t-norm is a continuous, associative, monotonically increasing function $* : [0, 1]^2 \rightarrow [0, 1]$ where $1 * x = x \quad \forall x \in [0, 1]$.

Residuum of a continuous t-norm *

The residuum of * is a function $\Rightarrow_*: [0,1]^2 \rightarrow [0,1]$ where $x \Rightarrow_* y := \max\{z | x * z \le y\}.$

- * is used as truth function for (strong) conjunction.
- \Rightarrow_* is used for as truth function implication.

ロト イポト イヨト イヨト

Popular t-Norms

The three most important t-norms are:

	t-Norm	Residuum
Łukasiewicz	$x *_{L} y = \max(0, x + y - 1)$	$x \Rightarrow_{L} y = \min(1, 1 - x + y)$
Gödel	$x *_G y = \min(x, y)$	$x \Rightarrow_G y = \begin{cases} 1 \text{ if } x \le y \\ y \text{ otherwise} \end{cases}$
Product	$x *_{\Pi} y = x \cdot y$	$x \Rightarrow_{\Pi} y = \begin{cases} 1 \text{ if } x \leq y \\ y/x \text{ otherwise} \end{cases}$

• Any continuous t-norm can be constructed from these three ones.

イロト イポト イヨト イヨ

Defining Connectives

Using * and its residuum \Rightarrow_* a logic L_* can be defined containing of

- the binary connective & (strong conjunction),
- the binary connective →,
- the constant \perp .

We can, furthermore, define the following derived connectives:

- $\neg A := A \rightarrow \bot$
- $A \wedge B := A\&(A \rightarrow B)$
- $A \lor B := ((A \rightarrow B) \rightarrow B) \land ((B \rightarrow A) \rightarrow A)$

Variants for Other Logics

Changing Evaluation Strategy

Joint Bets

A player has to pay $1 \in$ to his opponent, unless all experiments associated with his assertions test positively.

$\rightarrow \text{Product Logic}$

Selecting Representatives

Each player picks one of the propositions asserted by his opponent; if the associated experiment tests false, he is paid $1 \in$.

ightarrow Gödel logic

Variants for Other Logics

Changing Evaluation Strategy

Joint Bets

A player has to pay $1 \in$ to his opponent, unless all experiments associated with his assertions test positively.

 \rightarrow Product Logic

Selecting Representatives

Each player picks one of the propositions asserted by his opponent; if the associated experiment tests false, he is paid $1 \in$.

 \rightarrow Gödel logic

Variants for Other Logics

Changing Dialogue Rules

- just changing the evaluation scheme does not suffice
- introduction of the flag ¶ signalizing that in order to win the game, my risk has to be strictly negative
- dialogue rule for implication has to be adjusted
- loss of uniformity of rules for both players

Implication (by you)

If you assert $A \to B$ then, whenever I choose to attack this statement by asserting A, you have the following choice: either you assert B in reply or you challenge my attack on $A \to B$ by replacing the current game with a new one in which the flag \P is raised and I assert A while you assert B.

also other ways to change the implication rule

Other Topics

Other topics the thesis deals with:

- Proofs using relational hypersequents
- Truth comparison games
- Giles's Game for first order logic
- Devising rules for other connectives
- Using games to prove equivalences

• . . .

Giles Games

Hypersequential Proofs

Similarly, a tool to visualize proofs in the r-hypersequential calculus rH. Example: $\gg hypseq "a/(b->c)"$ produces:

Truth Comparison Games

A utility to find winning strategies for the proponent for a truth comparison game Example: $\$ tcgame "(a /\ b) -> (b /\ a) " produces:

$$\begin{array}{c} \left(\left(a \wedge b \right) \rightarrow \left(b \wedge a \right) \right) < \top \\ \left(\left(\left(a \wedge b \right) \rightarrow \left(b \wedge a \right) \right) < \top \\ \left(\left(a \wedge b \right) \rightarrow \left(b \wedge a \right) \right) < \top \\ \left(\left(a \wedge b \right) \rightarrow \left(b \wedge a \right) \right) < \top \\ \left(\left(b \wedge a \right) < \left(a \wedge b \right) \right) < \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right) < \left(a \wedge b \right) \\ \left(b \wedge a \right)$$

Christoph Roschger ()

Webgame

A web page where you can actually play Giles style dialogue games. Features:

- multiple undo and redo
- includes variants for Product and Gödel Logic
- elimination of connectives
- simulation of dispersive evaluation
- online at
