Historical perspective

• Query completeness problem has roots in the development of school system in Bolzano.

• Central school database is needed for administration, final grades, statistical reports etc.

• Teachers and admnistraters have only local records.

Settings

- People involved:
 - the KRDB group in Bolzano
 - the KBS group in Vienna
- Bolzano: developed theory of query completeness
- Vienna: developed a powerful disjunctive datalog engine (DLV)
- shortcoming of current theory lack of implementations

• Our goal: put theory into practise.

Motivation for Query Completeness

- When does query completeness matter?
- in data integration
- if several people, institutions independently contribute data

▲ロト ▲帰ト ▲ヨト ▲ヨト 三日 - の々ぐ

some data are final and others provisional

Query Completeness

- What does it mean for a query to be complete?
- Intuitevely it captures in the answer all tuples.
- Could you imagine that EMCL administration is missing you personal record?
- Now we can verify that everything is in the right place!¹

¹"Beware! I have only proved it correct, not tried it." Donald Knuth \Rightarrow \Rightarrow $\neg \land \circ$

Formalization [Motro 89]

Definition (Partial Database)

A partial database is a pair $D = (D^i, D^a)$ of two instances,

- the ideal database Dⁱ
- the available database D^a

such that $D^a \subseteq D^i$

Intuition:

- D^i reflects real world, what is really true
- D^a reflects data we physically store

Note (We make validity assumption)

there is no "wrong" data in the available database.

Partial Database Example

 D = (D^a, Dⁱ) is partial database with two students (Oliver & Wu) in two different classes (2b & 2a).

• Ideal Database $D^i = \{$

Student(Oliver," EMCL"), Class(Oliver,2,b), Student(Wu," ICCL"), Class(Wu,2,a)}

• Available Database $D^a = D^i \setminus Class(Oliver, 2, a)$

Note

Available database is missing the fact that Oliver is a second year student.

Formalism. Completeness

What does it mean for a query Q to be complete?

Definition

Q is said to be complete written as Compl(Q):

$$(D^{i}, D^{a}) \models Compl(Q)$$
 iff $Q(D^{i}) = Q(D^{a})$

Intuition: a query Q is complete if query evaluation over available database is the same as over ideal one.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Completeness Statements [Levy 96]

Peter confirmed:

"Workshop database contains all 2 year students "2

We formalize this as a table completeness statement:

$$Student^{i}(N,M), Class^{i}(N,2,C) \rightarrow Student^{a}(N,M)$$

or shortly **Compl(student(N,M) ; class(N,2,C))** General notation:

 $Compl(R(\bar{s}); G)$

where query $Q(\bar{s}) = R(\bar{s}), G$ is safe

²It is actually not true, right Martin?

TC-QC

Main question in the project how to implement the problem:

When completeness of small parts of the database entail completeness of the query?

Formally: TC-QC: table completeness entails query completeness

 $Compl(R_1, G_1), \ldots, Compl(R_n, G_n) \models Compl(Q)$

Example

All students in Dresden, Vienna, Bolzano and Lisbon are good, does it mean that all ECML students are good?

Query Containment

• Definition (Query Containment: Q_1 is contained in Q_2 written as: $Q_1 \subseteq Q_2$)

$$Q_1(D) \subseteq Q_2(D) \quad \forall D \text{ - db instances}$$

- Studied for conjunctive queries (CQ).
 - · Correspond to single-block select-from-where SQL query
 - Query that ask for good EMCL students:

 $Q(Name) \leftarrow Student(Name, "EMCL"), Good(Name).$

- Extensions: CQs with comparisons(≥,>), finite domains, unions of CQs.
- Complexity: from NP to $\Pi_2^{P,3}$

³Free Complexity Class tonight in the pub

Containment example

Given two queries Q_1 and Q_2

$$egin{aligned} Q_1(Name) &\leftarrow Student(Name, "EMCL"), Good(Name). \ Q_2(Name) &\leftarrow Student(Name, "EMCL"). \ Q_1 &\subseteq Q_2 \end{aligned}$$

The question whether all good EMCL student are among EMCL student?

And the answer is, of course, yes.

Opposite does not hold:

It is hard to beleive but there might exist not good EMCL students.

Algorithm for the TC-QC

TC-QC problem can be reduced to the variants of query containment.

Intuition:

- Query needs parts $\{P_i\}$ of the relation R_i to be complete
- Is P_i contained in the parts S_1, \ldots, S_n stated to be complete?

so containment:

$$P_i \subseteq S_1 \cup S_2 \cup \cdots \cup S_n$$

• Query containment can be in reduced to evalution task of different reasoning engines.

Implementation

Query containment can be in principle reduced to the

- ASP: done in DLV for Relational Case
- SMT: partially studied for comparisons in Z3.
- QBF: alternative approach in the future.

Future Work

• Investigate different faces of the problem e.g. finite domain contraint (now in progress)

- Develop different implementations: SMT, DLV, ASP+Difference logic, QBF.
- Create a uniform benchmark for different classes of languages(RQ,LQ,CQ,UCQ)

Evaluation of the project

A detailed report with complete results is going to be submitted to ESSLLI 2012 as an article and a poster.

Questions time

<joke>

- **Sir Humphrey**: If local authorities don't send us statistics, Government figures will be a nonsense.
- Hacker: Why?
- Sir Humphrey: They'll be incomplete.
- Hacker: Government figures are a nonsense, anyway.
- **Bernard**: I think Sir Humphrey wants to ensure they're a complete nonsense.

</joke>

Thank you for your attention.
